

Test Plan

Demo Web Shop

demowebshop.tricentis.com

Version: 1.0

Prepared by:

Mohammed Bazzar

1. Introduction

This document outlines the test plan for the functional testing of the Demo Web Shop web application (demowebshop.tricentis.com). It defines the testing strategy, scope, objectives, tools, and responsibilities. The document is intended for QA engineers and any stakeholders involved in the testing process.

2. Test Objectives

- Validate all functional modules: Registration, Login, Search, Cart, and Wishlist.
- Verify that all mandatory field validations work correctly on Registration, Login pages.
- Confirm that the search feature handles valid, invalid, and empty inputs correctly.
- Validate the end-to-end shopping cart flow for both guest and registered users.
- Identify, document, and report all defects found during test execution.
- Ensure no critical or high-severity defects remain open before test closure.

3. Test Scope

3.1 In Scope

- Registration Page — valid registration, validation errors, duplicate email, boundary values
- Login Page — valid login, wrong password, empty credentials
- Search — valid/invalid keyword search, no-results handling
- Shopping Cart — add from product page, search results, and home page
- Wishlist — add to wishlist, button presence verification
- Functional and validation testing on Chrome browser

3.2 Out of Scope

- Real payment or order processing (demo site only)
- Cross-browser testing (Chrome)

4. Test Strategy

Testing will follow a black-box approach — validating system behaviour through the UI without access to source code. All test cases are automated using Selenium WebDriver (Java) and executed on Google Chrome.

4.1 Testing Types

- Functional Testing — verify each module behaves as per the SRS requirements.
- Validation Testing — confirm all required fields reject invalid or empty inputs with proper error messages.
- Negative Testing — invalid inputs, wrong passwords, and empty searches are explicitly tested.

- Smoke Testing — homepage load and basic navigation verified before full execution.

4.2 Test Design Techniques

- Equivalence Partitioning — grouping valid and invalid input classes.
- Boundary Value Analysis — testing input limits (e.g. field length, quantity).
- Error Guessing — anticipating likely failure points based on the SRS validations.

5. Test Summary

#	Module / Page	Test Cases	Passed	Failed	Status
1	Login	3	3	0	Complete
2	Register	5	4	1	Complete
3	Search	2	2	0	Complete
4	Cart	3	3	0	Complete
5	Wishlist	3	2	1	Complete
	TOTAL	16	14	2	

6. Tools & Environments

6.1 Test Environment

Environment	OS	Browser	Notes
Test / QA	Windows 10	Google Chrome (latest)	Primary test environment

6.2 Testing Tools

Tool	Purpose
Selenium WebDriver (Java)	UI automation framework
TestNG	Test execution & reporting
Eclipse IDE	Development environment
ChromeDriver	Browser driver for Selenium
Git & GitHub	Version control and documentation

7. Test Deliverables

Before Testing:

Test plan document, test case sheet, test data preparation.

During Testing:

Automated test execution logs, TestNG HTML reports, defect reports for failed cases.

After Testing:

Final test execution report, bug report log, test summary report.

8. Entry & Exit Criteria

8.1 Entry Criteria

- The Demo Web Shop website is accessible at <https://demowebshop.tricentis.com>
- Test environment is configured (JDK, Eclipse, Selenium, TestNG, ChromeDriver installed)
- Test cases are designed, reviewed, and data is prepared
- SRS document has been reviewed

8.2 Exit Criteria

- All test cases have been executed
- All critical and high-severity defects are resolved and re-tested
- No open critical or major bugs remain
- Test summary report is completed

9. Roles & Responsibilities

Name	Role	Responsibilities
Mohammed Bazzar	QA Engineer	Design test cases, develop automation scripts, execute tests, log defects, prepare summary report

10. Document Approval

Name	Role	Approval Status	Date
Mohammed Bazzar	QA Engineer	Approved	June 2026
